ABSTRACT: A series of novel 2,4-disubstituted-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazines (PTDs) was prepared starting from a ring of pyrazolo[4,5-e][1,2,4]thiadiazine nuclei with two different alkyl halides obtained by a facile one-pot reaction. The structures of all synthesized compounds were confirmed by ¹H- and ¹³C-NMR, infrared spectra (IR), and mass spectra (MS) spectroscopic analysis. Anti-HIV activity was evaluated and none of the compounds were found to inhibit HIV replication in human T-lymphocyte (MT-4) cell culture.

Keywords: HIV, pyrazolo[4,5-e][1,2,4]thiadiazine, heterocycle, synthesis

1. Introduction

Fused heterocyclic thiadiazine derivatives such as pyridothiadiazines, pyrazinothiadiazines, imidazothiadiazines, triazolothiadiazines, and thienothiadiazines have become of particular interest to chemists and biologists because of their broad spectrum of biological activities and potential pharmacological applications in the treatment of cerebro/cardiovascular disease (1,2), cognitive disorders (3), cancers, and viral and bacterial infection (4,5). Among these derivatives, 2,4-disubstituted-1,1,3-trioxo-2H,4H-thieno[3,4-e][1,2,4]thiadiazines (TTDs) have been found to be potent non-nucleoside reverse transcriptase inhibitors (NNRTIs) of human immunodeficiency virus type 1 (HIV-1), which selectively block HIV-1 replication at the reverse transcriptase step (6). The lead compound QM96625 (Figure 1) displayed highly potent activity and selectivity against HIV-1 replication in human T-lymphocyte (MT-4) cells with an EC₅₀ value of 0.10 μM, CC₅₀ value > 119.0 μM, and SI > 1,190 (7.8).

In order to identify new HIV-1 NNRTIs, the current authors recently undertook a study of a series of 2,4-disubstituted-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazines (PTDs) because of the known bioisosterism between TTDs and PTDs (9). This previous work reported a regioselective method for synthesis of N₂- or N₁-monosubstituted PTDs (10) that was used to synthesize N₂,N₂-monosubstituted PTDs via a one-pot reaction (11). This work had also evaluated the anti-HIV-1 activity of PTDs and identified some N₂-monosubstituted and N₂,N₂-disubstituted PTDs that exhibited moderate anti-HIV-1 activity. As a continuation of this research on new anti-HIV-1 agents from PTD analogues, a series of novel 2,4-disubstituted-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazines were designed and synthesized based on the one-pot reaction that was previously established. The introduction of substituents at N₁ and N₂ moieties of the PTD heterocycle resulted in those substituents having the same anti-HIV activity as a series of TTDs. The current research describes the synthesis of novel disubstituted PTDs and screening of their anti-HIV activity based on cell cultures.

2. Materials and Methods

2.1. General methods

All melting points were determined on a micromelting point apparatus and are uncorrected. ¹H-NMR and ¹³C-NMR spectra were obtained on a Bruker Avance-600

(600 MHz; Bruker BioSpin, Rheinstetten, Germany) in the indicated solvent. Chemical shifts are expressed in δ units with TMS as the internal reference. Infrared spectra (IR) were recorded with a Nexus 470FT-IR spectrometer (Thermo Nicolet, Madison, WI, USA). Mass spectra (MS) were acquired with an LC autosampler device: standard G1313A instrument (Agilent Technologies, Santa Clara, CA, USA) and a AB Sciex API 4000 tandem mass spectrometer (Applied Biosystems, USA) with ESI. All compounds were routinely checked by TLC at 254 nm on pre-coated silica gel G plates with fluorescent indicator, which were prepared in the laboratory. Developed plates were visualized with UV light. Flash chromatography was performed on a column packed with silica gel 60 (230-400 mesh). Solvents were reagent grade and, when necessary, were purified and dried using standard methods. Concentration of the reaction solutions involved the use of a rotary evaporator at reduced pressure.

2.2. General procedure for the preparation of N₂,N₆-disubstituted 7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazines (3a-3p)

Sodium hydride (60% dispersion in mineral oil, 2 equivalent) was incrementally added to a solution of compound (1) (1 equivalent) (Scheme 1) in dry DMF in an inert atmosphere (N₂) and with the temperature below 10°C. After 30 min of stirring, the first alkyl halide (R₁X, 1 equivalent) was added dropwise. The mixture was stirred at room temperature for 20 min and 30-50°C for 12-20 h (checked by TLC). After the addition of the second alkyl halide (R₂X, 1 equivalent), the mixture continued to be stirred at 40-80°C for 12-20 h. After the solvent was evaporated off under reduced pressure, the crude product was purified by recrystallization from ethanol. Specific information on compounds 3a-3p is indicated in the Appendix.

2.3. In vitro anti-HIV assay

The methodology of the anti-HIV assay used here has been previously described (12,13). Stock solutions (10× final concentration) of test compounds were added in 25-μL volumes to two sets of triplicate wells so as to allow simultaneous evaluation of their effects on mock- and HIV-infected cells at the beginning of each experiment. Serial five-fold dilutions of test compounds were made directly in flat-bottomed 96-well microtiter trays using a Biomek 3000 robot (Beckman Instruments, Fullerton, CA, USA). Untreated control HIV- and mock-infected cell samples were included for each sample.

HIV-1 (IIIb) (14) or HIV-2 (ROD) (15) stock (50 μL) at 100-300 CCID50 (cell culture infectious dose) or culture medium was added to either the infected or mock-infected wells of the microtiter tray. Mock-infected cells were used to evaluate the effect of the test compound on uninfected cells in order to assess the cytotoxicity of the test compound. Exponentially growing MT-4 cells (16) were centrifuged for 5 min at 1,000 rpm and the supernatant was discarded. The MT-4 cells were resuspended at 6 × 10⁵ cells/mL, and 50-μL volumes were transferred to the microtiter tray wells. Five days after infection, the viability of mock- and HIV-infected cells was examined spectrophotometrically using the 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay.

The MTT assay is based on the reduction of yellow colored MTT (Acros Organics, Geel, Belgium) by mitochondrial dehydrogenase of metabolically active cells to a bluish-purple formazan that can be measured spectrophotometrically. Absorbance was read in an eight-channel computer-controlled photometer (Multiscan Ascent Reader, Labsystems, Helsinki, Finland) at two wavelengths (540 and 690 nm). All data were calculated using the median optical density (OD) of three wells. The 50% cytotoxic concentration (CC₅₀) was defined as the concentration of the test compound that reduced the absorbance (OD₅₄₀) of the mock-infected control sample by 50%. The 50% effective concentration (EC₅₀) was defined as the compound concentration required to inhibit virus-induced syncytium formation by 50%.

3. Results and Discussion

3.1. Chemistry

A ring of 7-methyl PTD nuclei (1) (Scheme 1) was prepared according to a previously reported procedure (10) and was purified by recrystallization from ethanol to yield a white solid in good yield (84%). N₂,N₆-disubstituted hetero[1,2,4]thiadiazines are usually prepared by stepwise alkylation. The first step of alkylation at the N₆ position usually produces a mixture of N₂- and O₂-monosubstituted products that must be separated by flash column chromatography before the second step of alkylation at the N₂ position. Use of one-pot regioselective alkylation avoids this complicated process (17). In brief, the ring of 7-methyl PTD nuclei (1) was dissolved in dry DMF (1 mmol/5 mL), which was cooled to under 10°C. Two equivlar NaH was added, followed by 1 equivlar R₂CH₂X, and then 1 equivlar R₁CH₂X was added when the intermediate of the mono N₂-substituted product (2) was obtained (checked by TLC). The crude product (3) was purified by recrystallization from ethanol to yield a white solid in good yield (Scheme 1). A series of N₂,N₆-disubstituted pyrazolo[4,5-e][1,2,4]thiadiazine derivatives (3a-3p) were prepared by this method and is listed in Table 1.

3.2. In vitro anti-HIV activity

Compounds 3a-3p were evaluated for their in vitro anti-HIV-1 activity by using the IIIB strain of HIV-1 and the ROD strain of HIV-2. Compounds were monitored for their inhibition of the virus-induced cytopathic effect in MT-4 cells. The results are summarized in Table 1, where the data for zidovudine and nevirapine have been included for comparison purposes. However, none of the compounds were found to inhibit HIV replication in MT-4 cell culture. Results revealed that the five-member ring moiety of the heterothiadiazines had a major role in affecting anti-HIV activity. As a result, PTDs had much lower activity than TTDs despite having very similar structures. This might be due to the fact that the pyrazole moiety of pyrazolothiadiazines is more hydrophobic than the thiophene ring of thienothiadiazines, which is ill-suited to the structural requirement for a hydrophobic body as is assumed in the "butterfly" model (17).

(3i). Compound (I) and 2-chlorobenzyl chloride were allowed to react at 40-50°C for 8 h. After the addition of 4-nitrobenzyl bromide, the mixture was allowed to react at 50-55°C for 12 h. Purification by recrystallization from ethanol yielded compound 3l as a white solid (70%), mp: 148-150°C. IR (KBr, cm⁻¹): 1,689 (C=O), 1,331, 1,193 (SO₂), 1,520, 1,278 (NO₂). ¹H-NMR (DMSO-d₆, 600 MHz) δ: 7.88 (s, 1H, PyH), 7.66 (dd, 1H, J = 7.93 Hz, J = 1.08 Hz, PhH), 7.19 (dd, 1H, J = 7.72 Hz, J = 1.10Hz, PhH), 7.25-7.37 (m, 7H, PhH), 5.12 (s, 2H, NCH₃), 5.08 (s, 2H, NCH₃), 4.06 (s, 3H, CH₃).

2-(p-Bromobenzyl)-4-(o-bromobenzyl)-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazine (3j). Compound (I) and 2-chlorobenzyl chloride were allowed to react at 40-50°C for 8 h. After the addition of 4-bromobenzyl bromide, the mixture was allowed to react at 50-55°C for 12 h. Purification by recrystallization from ethanol gave compound 3j as a white solid (68%), mp: 108-110°C. IR (KBr, cm⁻¹): 1,696 (C=O), 1,330, 1,192 (SO₂). ¹H-NMR (DMSO-d₆, 600 MHz) δ: 7.75 (s, 1H, PyH), 7.53 (d, 2H, J = 8.39 Hz, PhH), 7.50 (d, 1H, J = 7.76 Hz, PhH), 7.00 (d, 1H, J = 7.34 Hz, PhH), 7.28-7.32 (m, 4H, PhH), 5.15 (s, 2H, NCH₃), 5.00 (s, 2H, NCH₃), 4.08 (s, 3H, CH₃). MS (EI): m/z 495.2 [M + H]+ (calcd for C₁₉H₁₇N₅O₅S: 493.98).

2-(p-Bromobenzyl)-4-(o-bromobenzyl)-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazine (3n). Compound (I) and 2-bromobenzyl bromide were allowed to react at 30-40°C for 12 h. After the addition of 4-bromobenzyl chloride, the mixture was allowed to react at 50-60°C for 20 h. Purification by recrystallization from ethanol yielded compound 3n as a white solid (76%), mp: 146-148°C. IR (KBr, cm⁻¹): 1,696 (C=O), 1,330, 1,192 (SO₂). ¹H-NMR (DMSO-d₆, 600 MHz) δ: 7.74 (s, 1H, PyH), 7.67 (d, 1H, J = 7.81 Hz, PhH), 7.53 (d, 2H, J = 8.42 Hz, PhH), 6.93 (d, 1H, J = 7.58 Hz, PhH), 7.24-7.32 (m, 4H, PhH), 5.10 (s, 2H, NCH₃), 5.01 (s, 2H, NCH₃), 4.08 (s, 3H, CH₃). MS (EI): m/z 541.2 [M + H]+ (calcd for C₁₉H₁₉BrN₅O₅S: 537.93).

2-(4-Bromobenzyl)-4-(m-chlorobenzyl)-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazine (3o). Compound (I) and 3-chlorobenzyl chloride were allowed to react at 40-50°C for 20 h. After the addition of 2-Br benzyl bromide, the mixture was allowed to react at 40-50°C for 12 h. Purification by recrystallization from ethanol yielded compound 3o as a white solid (70%), mp: 108-110°C. IR (KBr, cm⁻¹): 1,680 (C=O), 1,327, 1,192 (SO₂). ¹H-NMR (DMSO-d₆, 600 MHz) δ: 7.91 (s, 1H, PyH), 7.66 (dd, 1H, J = 7.40 cm⁻¹): 1,701 (C=O), 1,337, 1,192 (SO₂). ¹H-NMR (DMSO-d₆, 600 MHz) δ: 7.88 (s, 1H, PyH), 7.66 (dd, 1H, J = 7.93 Hz, J = 1.08 Hz, PhH), 7.19 (dd, 1H, J = 7.72 Hz, J = 1.10Hz, PhH), 7.25-7.37 (m, 7H, PhH), 5.12 (s, 2H, NCH₃), 5.08 (s, 2H, NCH₃), 4.06 (s, 3H, CH₃).

2-(2-Chlorobenzyl)-4-(3-chlorobenzyl)-7-methyl-1,1,3-trioxo-2H,4H-pyrazolo[4,5-e][1,2,4]thiadiazine (3m). Compound (I) and 2-bromobenzyl chloride were allowed to react at 30-40°C for 12 h. After the addition of 4-bromobenzyl bromide, the mixture was allowed to react at 40-50°C for 12 h. Purification by recrystallization from ethanol yielded compound 3m as a white solid (70%), mp: 128-130°C. IR (KBr, cm⁻¹): 1,695 (C=O), 1,331, 1,192 (SO₂). ¹H-NMR (CDCl₃, 600 MHz) δ: 7.12 (s, 1H, PyH), 7.60 (dd, 1H, J = 7.83 Hz, J = 1.15 Hz, PhH), 6.88-7.47 (m, 7H, PhH), 5.15 (s, 2H, NCH₃), 5.08 (s, 2H, NCH₃), 4.14 (s, 3H, CH₃).
